T023: LoadLibrary failed with Error 87 when connecting to a remote computer.

This issue is caused by a conflict in the video driver used by the video card and the driver used by the Remote Desktop session. Here's how to resolve this.

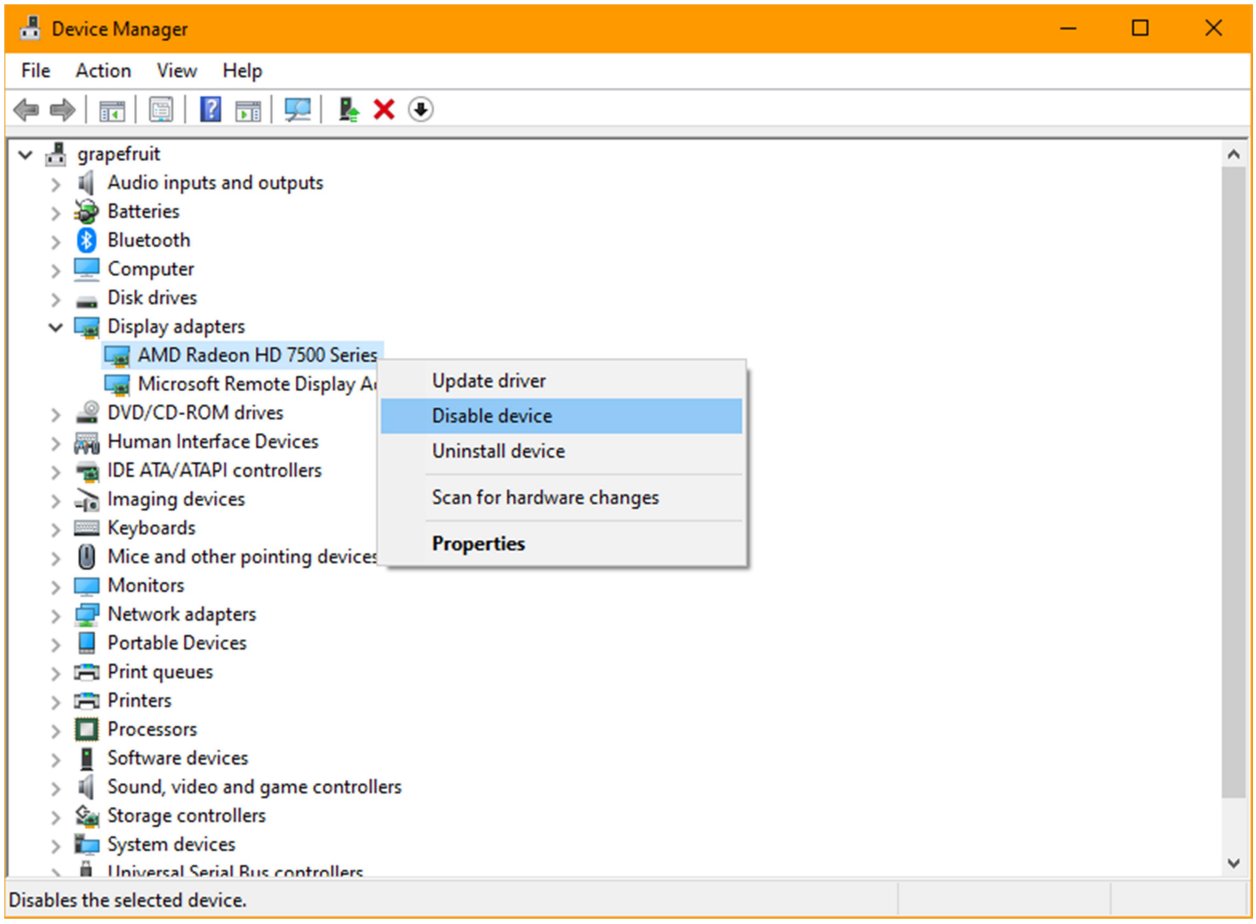

On the remote computer, search for "Device Manager" in the Start menu.

In the Device Manager, expand the Display adapters. You should see two drivers; one for the physical graphics card (NVIDIA, AMD, etc.), and one named "Microsoft Remote Display". We will be disabling the physical graphics card.

Right-click on the physical graphics card (in this case an AMD Radeon HD 7500 series card) and select “Disable device”. DEFORM should now run correctly.

Please remember to re-enable the driver before ending the remote session.
